

AMOG White/Yellow Mustard

(Sinapis Alba, nematode resistant)

AMOG is high yielding and fast ground covering and with a high nematode reduction ability.

AMOG is registered on the official Belgian variety list with the following characteristics:

- x High yield of valuable organic matter
- x Very fast soil covering 8.0 (rate 1-9)
- x Diploid variety
- x Mid-Late flowering 6.5 (rate 1-9)
- x Intensive, deep-reaching root system
- x Active protection against erosion
- x Height of plants (110cm)
- x Resistant to lodging
- x High nematode reduction

AMOG can be sown till very late in the autumn. It grows very quickly providing good ground cover, making it an excellent green manuring crop.

Once AMOG is established it develops rapidly, it tolerates late sowing and is impervious to drought. Its intensive far-reaching rootsystem creates a solid soil structure rich in humus.

- Sowing** : early July until late September
Seed density : 15 – 20kg/ha
Seed depth : 1 – 2 cm
Fertilization : 40 - 60 kg/ha N
